

Code Alpha Internship Under Domain UI / UX Design

Name: Lobhas Mahesh Kulkarni

Date: 17/06/2026

Day: Wednesday

TASK 1: Wireframing & Low-Fidelity Design

1. Create wireframes for a mobile app or website (e.g., food delivery, e-commerce or education platform).
2. Submit wireframes in Figma/Adobe XD.

Foody Express – Wireframing & Low-Fidelity Design

Introduction

With the increasing demand for online food delivery services, users expect applications that provide a fast, convenient, and seamless ordering experience. A well-designed user interface plays a crucial role in ensuring customer satisfaction by simplifying the process of browsing restaurants, selecting meals, placing orders, and tracking deliveries.

Foody Express is a mobile food delivery application designed to connect users with nearby restaurants and enable efficient food ordering. This project focuses on creating low-fidelity wireframes that establish the application's structure, navigation, and overall user experience before moving to detailed visual design and development.

Project Overview

The Foody Express wireframing project aims to design the fundamental layout and user flow of a food delivery application. The wireframes represent the application's key screens and interactions, allowing designers and stakeholders to evaluate usability, functionality, and navigation early in the design process.

The low-fidelity wireframes emphasize information architecture, screen hierarchy, and user journeys without focusing on colours, typography, or visual styling. This approach helps identify design improvements before investing time in high-fidelity prototypes.

Problem Statement

Many food delivery applications contain complex navigation and lengthy ordering processes that can negatively impact the user experience. Users require a platform that allows them to quickly discover restaurants, browse menus, place orders, and track deliveries with minimal effort.

The challenge is to design an intuitive and user-friendly mobile interface that streamlines the ordering process while maintaining clarity and ease of use.

Objectives

The primary objectives of the Foody Express wireframing project are:

1. Design a simple and intuitive food ordering experience.
2. Create a clear navigation flow between application screens.
3. Improve accessibility and usability for users.
4. Minimize the number of steps required to place an order.
5. Establish a foundation for future high-fidelity designs and prototypes.

Target Audience

The application is intended for:

1. Students seeking convenient meal options.
2. Working professionals with limited time for cooking.
3. Families ordering food for home delivery.
4. Individuals looking for quick access to nearby restaurants.

Design Approach: The wireframes were developed using a low-fidelity design approach to focus on functionality rather than aesthetics. Each screen was designed to support the user's journey from login to order confirmation.

The design process included:

1. Identifying user requirements.
2. Defining the application flow.
3. Creating screen layouts and navigation structures.
4. Designing wireframes for core functionalities.
5. Evaluating usability and consistency across screens.

User Flow

Login/Register → Home Screen → Restaurant Menu → Add Items to Cart → Cart Review → Checkout → Order Confirmation

Wireframe Screens

Screen 1 – Login & Registration

Provides secure access to the application through user authentication and account creation options.

Screen 2 – Home Screen

Displays food categories, restaurant listings, search functionality, and promotional content.

Screen 3 – Restaurant Menu

Allows users to browse menu items, view prices, and add food items to the cart.

Screen 4 – Cart Screen

Provides a summary of selected items along with pricing, taxes, and delivery charges.

Screen 5 – Checkout Screen

Enables users to review delivery information, payment methods, and order details before confirming the purchase.

Screen 6 – Order Confirmation Screen

Displays order details, estimated delivery time, and options to track the order.

Conclusion: The Foody Express low-fidelity wireframes successfully outline the structure and workflow of a modern food delivery application. The design focuses on usability, simplicity, and efficient navigation, ensuring that users can complete food orders with ease. These wireframes serve as the foundation for future high-fidelity designs, interactive prototypes, and application development.
